Technical Letter  
No. 1110-2-XXXX

30 September 2012

### EXPIRATION DATE Engineering and Design FREQUENCY CURVE EXTENSION FOR EXTREME FLOOD EVENTS

1. **Purpose.** This engineer technical letter (ETL) provides guidance for the development of inflow frequency curves that extend to the Probable Maximum Flood (PMF). The inflow frequency needs to address both the peak inflow and the volume associated with events of various durations. Furthermore, the coincident basin condition downstream of a project needs to be appropriately correlated with the hydrologic scenario that is defining the project inflow.
2. **Applicability.** This ETL applies to all HQUSACE elements and all USACE commands having Civil Works responsibility for hydrologic analysis associated with dam safety studies, and other projects that require analyzing flow frequencies out to very rare events.
3. **Distribution Statement.** Approved for public release, distribution is unlimited.
4. **References.** See Appendix A.
5. **Discussion.** Currently there is no credible scientific approach to assign a single probability to a flood of the magnitude of the PMF. Additionally, no single method exists for extending gaged frequency curves out to the PMF level. This ETL presents a process for development of credible estimates of infrequent Annual Exceedance Probabilities (AEP) that rely on the use of data from multiple sources and a regional approach.

Quantification of the frequency curve out to rare events, such as the PMF, is necessary to evaluate the hydrologic risk for any project. Per the National Weather Service, the Probable Maximum Precipitation (PMP) is theoretically, the greatest depth of precipitation for a given duration that is physically possible over a given storm area at a particular geographical location at a certain time of the year. The PMF is a function of the PMP and basin conditions and is characterized as the upper limit of hydrologic loading for the Corps dams. While the frequency curves must be defined out to the PMF, more emphasis needs to be placed on defining the curves from the 100-year to the 5,000-year event, as this area of the curve plays a much more important role in the Portfolio Risk Assessment (PRA) analysis. Several techniques have been identified as candidates for use. The technical basis, data and resource requirements for each are summarized in the following chapters. As several of these various techniques may be used for any project, a method is described for blending the resultant frequency curves to prepare the adopted frequency curve. It is important to note that the application of these methods requires an experienced

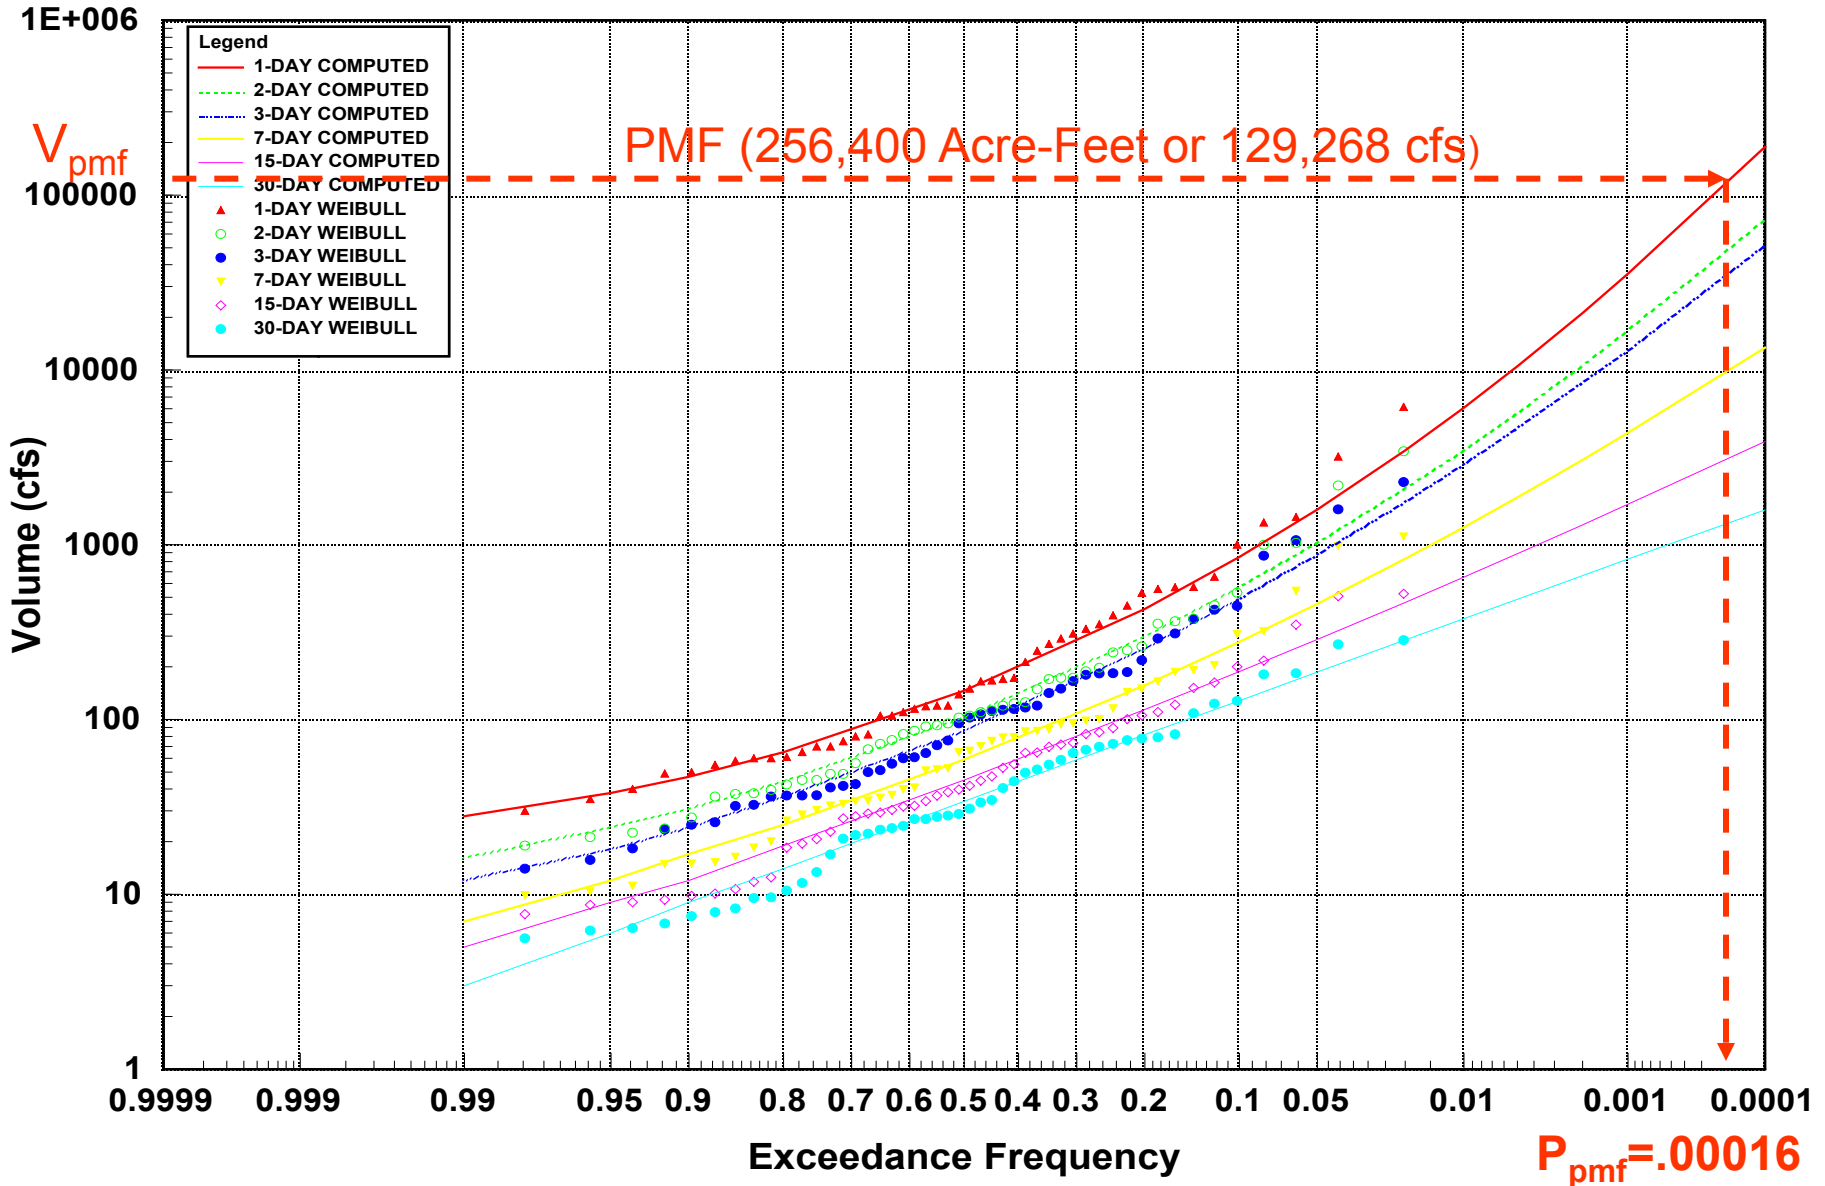

# Methods to Extend Frequency Curves

1. Extension using Bulletin 17B Methods
2. Hydrologic Modeling using frequency based storm events
3. Regional Probability of the PMF
4. Stochastic Event Flood Model (SEFM)
5. Application of the GRADEX Method
6. Utilization of Paleoflood Information

The screenshot shows the NOAA's National Weather Service Hydrometeorological Design Studies Center (HDSC) Precipitation Frequency Data Server (PFDS) website. The page features a blue header with the NOAA logo and the text "NOAA's National Weather Service Hydrometeorological Design Studies Center Precipitation Frequency Data Server". Below the header is a navigation bar with "News" and "Organization" links, and a search box labeled "Search" with the text "All NWS search" and a "Go" button. The main content area includes a "State:" dropdown menu with the text "Choose a state (or click map)" and a "Load" button. Below this is a map of the United States with a legend indicating "Updated data available" for several states. The states with updated data are highlighted in light blue: CA, NV, UT, AZ, NM, CO, KS, MO, IL, IN, OH, PA, NY, VA, NC, TN, SC, and FL. The rest of the states are shown in light gray. A sidebar on the left contains a list of links: "Precipitation Frequency Data Server (PFDS)", "General Precipitation Frequency Information", "GIS Grids/Shapefiles", "Cartographic Maps", "Temporal Distributions", "Time Series", "FAQ", "PFDS Performance", "HDSC Home Page", "Contact Us", "Inquiries", and "List-server". At the bottom left of the sidebar is the "USA.gov" logo. At the bottom right of the page is the "BUILDING STRONG" logo.
